

Problem G – Birthday Numbers

Time limit : 3 seconds

Problem Description

The computer camp staff found something interesting while chatting. This year's head organizer was born on February 7 (2/7), and last year's head organizer was born on September 16 (9/16).

Someone said, "No matter how we pair the numbers, they are all relatively prime!"

Everyone checked the numbers right away. But they found that 2 and 16 are not relatively prime because 16 is a multiple of 2. It was a funny little mistake.

Except for this pair, the other pairs (2 and 7, 2 and 9, 7 and 9, 7 and 16, and 9 and 16) are all relatively prime.

Since we are already checking these numbers, let's try one more thing:
Given two positive integers, find their greatest common divisor.

Input Format

Your program is to read from standard input. The input consists of T test cases. The number of test cases T is given in the first line of the input. Each test case contains two positive integers a and b , separated by a space, where $1 \leq a, b \leq 1,000,000$.

Output Format

Your program is to write to standard output. For each test case, print one line containing the greatest common divisor of a and b .

Technical Specification

- You may assume all the input values are all integer numbers.
- $1 \leq T \leq 1,000$.

Sample Input

3

2 7

9 16

7 16

Sample Output

1

1

1
